#### Summarizing open, close, high, low by year

Open summary by year

```
Open_summary <- df %>% group_by(year) %>% summarize(mean = mean(Open), median = median(Open), min= min print(Open_summary)
```

```
## mean median min max
## 1 284.9406 299.475 108 857
```

#### Close summary by year

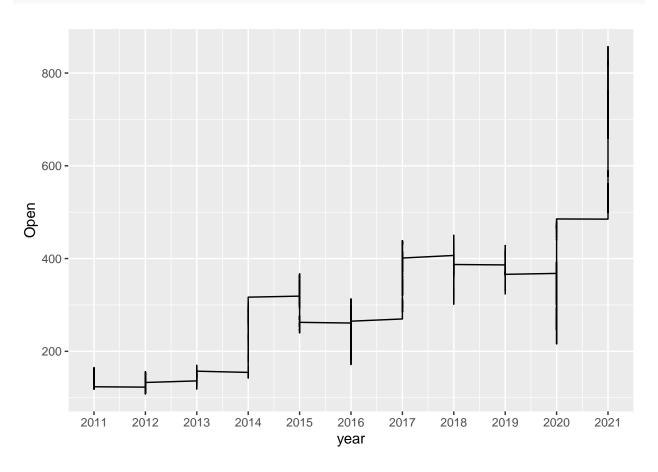

```
Close_summary <- df %>% group_by(year) %>% summarize(mean = mean(Close), median = median(Close), min= m print(Close_summary)
```

```
## mean median min max
## 1 284.6273 298.75 108 835.55
```

### Random plots for fun

compare opening price through the years w line graph

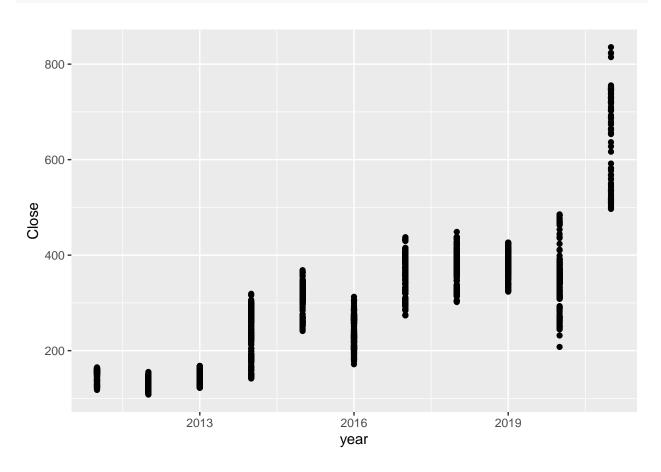

```
ggplot(data = df, aes(x = year, y = Open)) + geom_line() + scale_x_continuous(breaks = seq(min(df$year), n)
```

#### Create a scatter plot for open price

 $ggplot(data = df, aes(x = year, y = Open, color = year)) + geom_point() + scale_x_continuous(breaks = seq(min(dfyear), max(dfyear), by = 1))$ 

# Scatterplot of year and close price

## Histogram for close price

ggplot(df, aes(x = Close)) + geom\_histogram(binwidth = 1) #Line plot of open prices plot(df\$Open, type='

Create a target column where 'Up' if Close > Open, 'Down' otherwise for SVM

```
df$target <- ifelse(df$Close > df$Open, "Up", "Down")
```

Convert the target column to a factor

```
df$target <- as.factor(df$target)</pre>
```

Check the levels of the factor to make sure they are "Up" and "Down"

```
levels(df$target)
```

## [1] "Down" "Up"

Split the data into training and test sets

Set seed

```
set.seed(123)
```

#### Training data

```
train_indices <- sample(1:nrow(df), 0.8*nrow(df))
train <- df[train_indices, ]</pre>
```

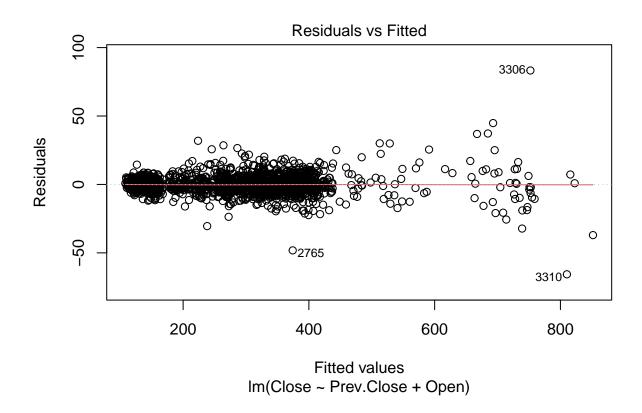

Testing data

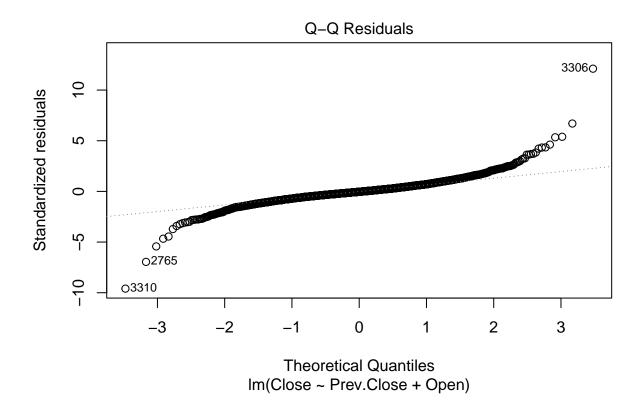

```
test <- df[-train_indices, ]</pre>
```

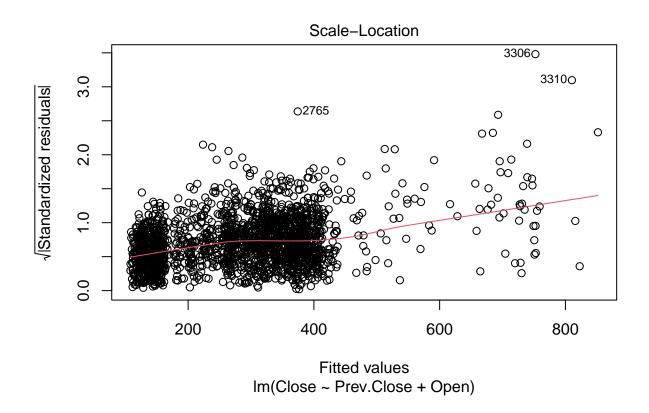

Fit the linear regression model for close based on previous close prev.close

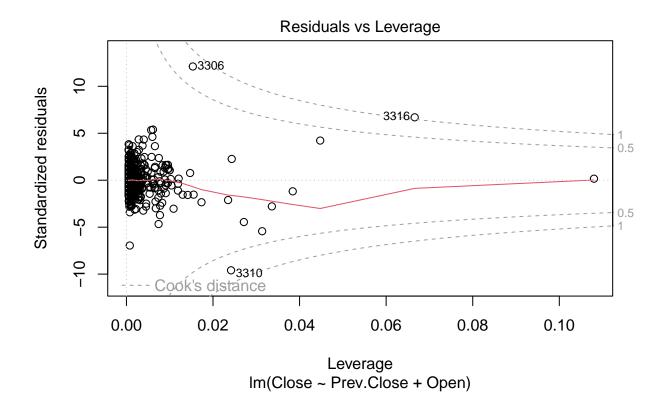

```
model_fit <- lm(Close ~Prev.Close + Open , data = train)</pre>
close_predictions <- predict(model_fit, newdata = test)</pre>
summary(model_fit)

print(paste("R-squared for closing price:", r_squared))

## [1] "R-squared for closing price: 0.996854728114382"
```

### Plot actual vs predicted close prices

```
ggplot(data = test, aes(x = close_predictions, y = Close)) + geom_point() + geom_abline(slope = 1, inter
```

### Predicted vs Actual Close Prices

Train the SVM model using the 'open' and 'close' variables as predictors to see if it can predict price going up or down

\*Not a very good model, could keep tweaking but would rather try others

\*Tried to optimize, not very successful

```
train_control <- trainControl(method = "cv", number = 10)
tune_grid <- expand.grid(C = seq(0.01, 1, by = 0.1))</pre>
```

\*Cross-validation before it was guessing at .5, randomly, .5 after

#### SVM Model

```
svm_model <- train(target ~ Open + Prev.Close, data = train, method = "svmLinear", trControl = train_c</pre>
```

Make predictions on the test set using the trained model

```
predictions <- predict(svm_model, newdata = test)</pre>
```

Evaluate the model's performance using a confusion matrix

```
confusion_matrix <- confusionMatrix(predictions, test$target)
print(confusion_matrix)</pre>
```

```
